## DIPLOID ITALIAN RYEGRASS

Oryx is a early-medium maturing, diploid Italian ryegrass developed in Switzerland for increased forage matter production, improved disease resistance, and excellent winter hardiness. Oryx has a very low tendency to form seedheads in forage aftermath which increases quality. Swiss trials have shown that Oryx has higher sugar content than other diploid varieties. Its resistance to rust, leaf spot, and mildew allows it to maintain plant health and produce high quality forage throughout its growing season. Oryx has deep roots and excellent seedling vigor during establishment and superior early spring growth. Oryx has a high level of nonstructural carbohydrates and good palatability making it an excellent choice for early spring grazing or haylage.

### APPLICATIONS

- Excellent spring and early summer grazing
- Excellent for haylage or baleage
- High quality

### MANAGEMENT

- Seeding Rate (pure stand): 25 - 30 pounds per acre
- Seeding Rate (interseeding): 15 - 20 pounds per acre
- Planting Depth: 1/4 - 1/2 inch

### FEATURES

- Long, narrow leaves
- Excellent disease resistance
- High sugar content
- Excellent winter hardiness

### BENEFITS

- Excellent for grazing and haylage
- Improved health and persistence
- Improved palatability and animal performance
- Improved persistence in northern climates
